

# E-R DIAGRAM

\*Here, we have created a new table for stadium name because a city can have multiple stadium or a certain city like "kolkata" can have only one stadium so storing it again and again will cause redundancy and also cause anomalies like update, insert, delete

\*Here, we have created a new table for captain because imagine a situation if the captain of the team will get injured then new captain will be assigned and if it doesn't get injured then we need to enter the same captain name of a team again and again which will increase redundancy and cause anomalies like update anomalies, delete anomalies, insert anomalies
